## CHILDREN, TEENS, AND ADULTS (AGES 5-64)

[covidvaccineproject.org](https://covidvaccineproject.org)

An updated COVID-19 vaccine is recommended for people ages 5-64 years.

COVID-19 has not gone away and remains a threat to your health and the health of your family and friends. Getting vaccinated against COVID-19 is a safe and effective way to help protect against the virus and reduce the likelihood of experiencing severe symptoms if you or your child do get infected.

Millions of individuals across the United States have been safely vaccinated against COVID-19. Ongoing safety monitoring efforts continue to demonstrate that COVID-19 vaccines are safe and effective for people of all ages.

### GETTING "UP TO DATE"

Everyone ages 5 years and older, including those who haven't been previously vaccinated, should get one dose of the updated COVID-19 vaccine, at least two months after their last vaccine dose.

### PEOPLE WHO ARE IMMUNOCOMPROMISED

Moderately or severely immunocompromised people may receive additional doses of the updated COVID-19 vaccine. Talk to your or your child's healthcare provider to ensure you are up to date.

### VACCINE CO-ADMINISTRATION

It is safe for you or your child to receive COVID-19 vaccines at the same time as other routine vaccinations.

### VACCINATION AFTER COVID-19 INFECTION

People who recently had COVID-19 should delay their next vaccine dose by three months from when symptoms started, or, if asymptomatic, three months from when they first received a positive test.

### Treatment Options

If you are infected with COVID-19, there are antiviral treatments available that can help reduce the severity of symptoms and the risk of hospitalization and death if taken within the first few days of symptom onset. Talk to your healthcare provider to see if a COVID-19 antiviral treatment is the right option for you or your loved one.

AM I  
AT RISK?

Learn more about your risk of developing severe COVID-19 and determine if an antiviral treatment may be right for you.
